

Does likelihood recovery certify capability recovery?

Observed OLMo-2-7B paths; one training run per construction; PPL uses a same-source held-out Dolmino shard

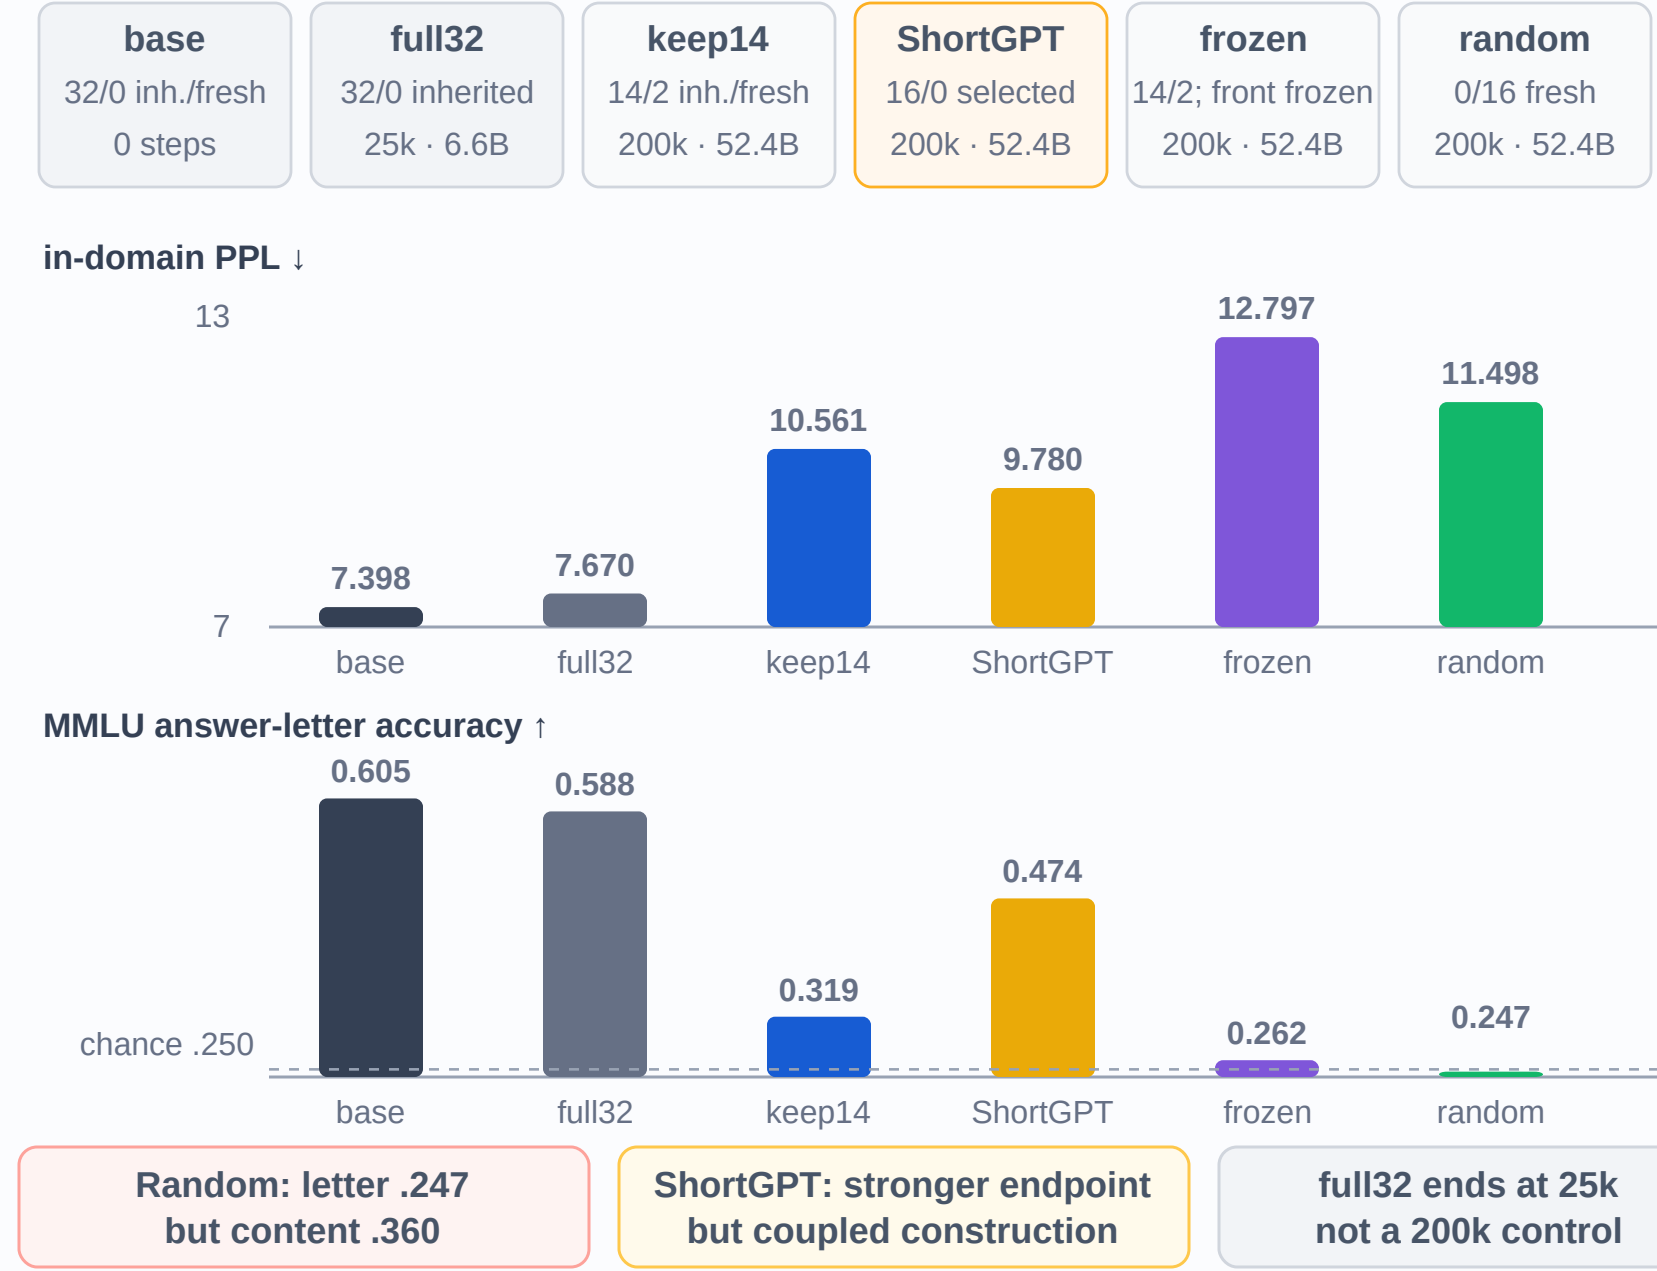

A Literal keep14 observed path

Both measured axes improve over the available late checkpoints, but lower in-domain PPL does not certify base-level performance.

Single run; no seed-level uncertainty. Item-level CIs condition on these checkpoints.

B Endpoint and null operating points

Supported: in-domain PPL is an insufficient certificate for these knowledge-sensitive evaluations on the literal observed paths.

No causal, localization, deletion, or universal-dynamics claim.
